

**For:** Deck Forge

**Answered Problem Sections (Does it address your questions as you posed them?):**

Yes it does address my questions posed to them. They went through every option thoroughly and came out with one conclusion.

**5/5**

**Technique judgment (Did they choose a defensible approach (supervised/unsupervised) given how you worded the problem?):**

Yes they did. They came out unsupervised which I agree to be the correct choice since no archetype labels exist and hand-labelling would defeat the purpose. So separating the trainers and energies I agree with.

**5/5**

**Evaluation/interpretation quality (Are the metrics (supervised) or the interpretation (unsupervised) actually connected back to your success criteria?):**

Mostly yes. The group names make sense right away and I like that they checked the cards by hand and were upfront that some cards fit in more than one group. But they never told me how many cards ended up in each group, so I can't tell if one group is holding most of the cards. The interpretation also stops at the groups making sense, when what I asked about was new players being overwhelmed.

**4/5**

**Communication (Is the presentation and notebook summary understandable to your stakeholder, not just to another data scientist?):**

Yes for the most part. It was easy to follow and didn't get too technical, and the part on how they pulled the stats out of the cards explained itself well. A few things like "stage 0" and "damage per energy" went unexplained, and the slide with the mechanic percentages didn't say why those numbers mattered to the decision.

**4/5**

**Feedback:**

I think it was very solid and pretty well put together. Concluding on option A was the right idea and it's the option that holds up best as more cards get added. Some areas of improvement would be a little more focus on the player side, what they'd actually see if these groups exist, when they see it, how they see it, etc. I like the starter deck idea as well, that's a great starting point. Overall there were parts that just needed a little more detail, but it was definitely well made and put together.
